AB	Corn oil and corn meal obtained from corn are included in useful products. The corn oil is extd. from the corn to form the corn meal. The corn grain process generally includes the steps of cracking corn grain having a total oil content of from about 3% to 30% by wt. and extg. the corn oil from the cracked corn grain. The corn oil is useful for making nutritionally enhanced edible oil or cooking oil, lubricants, biodiesel, fuel, cosmetics and oil-based or oil-contg. chem. products. The extd. corn meal is useful for making enhanced animal feed rations, snack food, blended food products, cosmetics, and fermn. broth additive.

AB	Vitamin A-contg. pharmaceutical aerosols for use on the respiratory tract mucosa are provided for treatment of disorders affecting the respiratory epithelium, e.g. neoplasms, metastases, squamous metaplasia, bronchitis, and newborn bronchopulmonary dysplasia. These compns. contain satd. hydrocarbons as solubilizers to improve the aerosolization of the active agent. At low concns., these hydrocarbons do not display the flammability, toxicity, and unpleasant flavor seen at higher concns. Thus, an aerosol prepn. contained retinol palmitate 1.10, DL- $\alpha$ -tocopherol 0.11, tetrafluoroethane 76.71, and isobutane 22.08 wt.%.  AB The optothermal window detection method at 488 nm was used to monitor  
 online the concn. of trans- $\beta$ -**carotene** that was added to several  
**vegetable oils** after treating them at 200° in the presence of  
 air for varying amts. of time. Results obtained for extra virgin oil show  
 a direct proportionality between the rate const. describing the  
 disappearance of trans- $\beta$ -**carotene** and the duration of **thermal**  
 treatment. The rate const. for the decay of trans- $\beta$ -**carotene** in  
 oils treated under identical conditions was also dependent on the type of  
 oil. Trends and individual data are discussed in the light of a possible

# STN Columbus

AB	Disclosed is a process for producing a <b>carotenoid</b> emulsion which comprises <b>heating</b> a suspension of the <b>carotenoid</b> in a high boiling org. liq., by passing the suspension through a conduit of 0.1 to 50 mm inside diam. <b>heated</b> to temp. at 120-700° for a residence time of 0.05 to 5 s or by mixing the suspension with a high boiling org. liq. <b>heated</b> to the range of 120 to 500° for a time of 0.05 to 10 s, to dissolve the <b>carotenoid</b> , and then immediately adding the resulting soln. into an aq. soln. of an emulsifier to emulsify the soln. By this prodn. process, an emulsion contg. a <b>carotenoid</b> as an effective ingredient can be produced with the <b>carotenoid</b> maintaining a high total trans-form proportion, with good productivity, conveniently, and industrially advantageously.

AB	An oil-in-water emulsion suitable for use in the prodn. of low-fat analogs of margarine, mayonnaise, or cheese is prepd. from an emulsifier, a thickening agent, a fat with a Wiley m.p. of 24-41° and a solid fat index at 35.5° of ≤20 and at 37.5° essentially zero, and optionally flavoring and coloring agents. Thus, water (68.31%) was mixed with Methocel K-100M (hydroxypropylmethyl cellulose) [9004-65-3] (0.5%), Avicel RC 581 (cellulose prepn.) [51395-75-6] (0.5%), and β-carotene (0.09%) with heat; Dur-em 114 emulsifier (monoglycerides) (4.0%), dewaxed corn oil (11.25%), hydrogenated cottonseed-soybean oil (13.75%), and artificial butter flavor (0.1%) were added; the material was homogenized at 1000-2000 psig; salt was added; and the emulsion was cooled, yielding a margarine-like product.

AB A stable clear pan release agent consists of 0.25-2% by wt. Polysorbate 80 [9005-65-6] in a mixt. of 2 or more oils, the major oil being liq. at room temp., and the minor one being solid at room temp. The oils are agitated at ~74°, rapidly chilled and worked to at least 25°; worked at that temp., and combined with CO2 propellant to yield an aerosol product. Thus, about half of 2675 lb soybean oil and 1784 lb coconut oil were **heated** and mixed to 70°, the immersion **heaters** were cut off, 240 lb double-bleached lecithin was mixed in for 10 min, the balance of the soybean and coconut oils was added followed by 36.9 lb Polysorbate 80, 2.4 lb BEX butter deriv., and 3.8 or  $\beta$ -**carotene**. The batch was mixed for 3 min, cooled to ~60°, and passed through a 2-stage homogenizer (1000 and 3500 psi, resp.), and cooled to ~38°. The blend was agitated rapidly in a Votator while chilling to ~21°, and then worked with a high-speed paddle mixer. The product was clear and brilliant.

AB		<b>Corn oil and corn meal obtained from corn are included in useful products. The corn oil is extd. from the corn to form the corn meal. The corn grain process generally includes the steps of cracking corn grain having a total oil content of from about 3% to 30% by wt. and extg. the corn oil from the cracked corn grain. The corn oil is useful for making nutritionally enhanced edible oil or cooking oil, lubricants, biodiesel, fuel, cosmetics and oil-based or oil-contg. chem. products. The extd. corn meal is useful for making enhanced animal feed rations, snack food, blended food products, cosmetics, and fermn. broth additive.</b>

AB Quality aspects of solid biofuels were investigated in a new database. Most parameters varied greatly, particularly when annually harvested biomass was considered. For planning purposes the frequency distributions should be used rather than mean values. The quality of some crops may be changed by modified agricultural practices. Rainfall shortly after cutting can deplete chlorine and potassium in grass by 60 to 80%.
